

The radio spectrum is a resource that can be used for many purposes. Broadcast over Power Line will radiate and cause interference to all other users from 2 to 80 MHz.

Amateur Radio would be greatly impacted by this interference. It would be a detriment to amateurs enjoyment of this "national park". This interference would cut down on our ability to develop and enjoy the relationships we share with amateurs the world over. This interference would hinder the ability of amateurs to provide the service during disasters. Amateur radio operators have a long history of providing not just communications, but skills and infrastructure (relay stations and packet nodes, etc.) to serve communities in time of duress. Other means of digital access must be found that will not pollute the radio spectrum. It can and must be done.
